The Clock Tower
The Clock Tower

The history

The Clock Tower is one of the most famous architectural landmarks in Venice, standing over an arch that leads into what is the main shopping street of the city, the old Merceria. It marks both a juncture and a division between the various architectural components of St. Mark’s Square, which was not only the seat of political and religious power but also a public space and an area of economic activity, a zone that looked out towards the sea and also played a functional role as a hub for the entire layout of the city. In short, the Tower and its large Astronomical Clock, a masterpiece of technology and engineering, form an essential part of the very image of Venice. For more than 500 years, they have measured out the flow of life and history within the city.
As is known, the decision to erect a new public clock in the St. Mark’s area to replace the inadequate, old clock of Sant’Alipio on the northwest corner of the Basilica – which was by then going to rack and ruin – predates the decision as to where this new clock was to be placed. It was 1493 when the Senate commissioned Carlo Zuan Rainieri of Reggio Emilia to create a new clock, but the decision that this was to be erected over the entrance to the Merceria only came two years later. According to Marin Sanudo, the following year “on 10 June work began on the demolition of the houses at the entrance to the Merceria (...) to lay down the foundations for the most excellent clock”. The diarist would later record, on the 1st February 1499, that the structure having been completed and the mechanism mounted “the clock on the Square was unveiled for the first time; above the street that leads into the Merceria, it is most beautiful and ingenious”. From the archway at ground level, the vertical structure rises on a rectangular base of around 9x6 metre through a quadruple series of scaled architectural orders to a terrace with the statues of the Moors. At the time of its construction, it marked a clear break with the architectural language and layout of St. Mark’s Square, which was still substantially as it had been created in the time of Sebastiano Ziani (12th cent.). Following rulings handed down in 1500, and reiterated in 1503, the two side wings to the tower – culminating in two balustraded terraces – were built over the next five years. It should, however, be noted that it was not until after the fire of 1512 that plans got underway to rebuild the Vecchie Procuratie alongside (demolition of the existing structure started in February 1513). But the Tower was also to play a key role in the overall urban layout of the city, being an essential point of focus along the two main sight-lines of façades (along the Merceria or from St. Mark’s Square itself). From St. Mark’s it stands as a triumphal archway and monument marking access to the city’s main commercial artery; from the Merceria, it serves as a sort of telescope, offering a perceptive view that takes in the seats of political power and the city’s waterfront. More or less convincing evidence has been brought forward to attribute the structure to Mauro Codussi. The design of the architectural orders is similar to that which can be seen in some of his other buildings; the same can also be said of the architectural nuances in design, and the sure way in which the ornamentation of the tower is subordinate to the structure as a whole (this decoration is particularly rich and perhaps eclectic, with various artists being involved in the production of the clock faces and the celebratory motifs included within the tower). In the mid 18th century Giorgio Massari raised the side wings above the terraces and added new balustrades; at the same time eight columns were added, reducing the light through the trabeation at ground level (this addition was almost certainly not the work of Tommaso Temanza, as is often claimed, but of a lesser-known architect, Andrea Camerata). However, neither of these changes could really disturb the power of the original design; though the whole was made rather heavier. The work on the interior of the structure that was carried out in the nineteenth century (at the same time as that on the mechanism of the clock itself) was much more drastic: the wooden stairs were torn out and replaced with spiral staircases in metal, and the roofing of larch and lead sheeting was replaced with brick vaults and marble slabs (even the statues of the Moors were raised about a metre above their original level).
South clock face to the St. Mark’s Square

This clock face comprises: a fixed marble circle inscribed with the hours in Roman numerals; a mobile larger ring, bearing the signs of the Zodiac and the related constellations, the names of the months and the number of the days; a thinner ring bearing the hour hand in the form of a sun with a long ray; and an inner disk with the Earth (at the centre) and the Moon, which rotates on its axis to represent its various phases.

The clock face as it appears nowadays is the result of a simplification of the late 15th century original, which also had the planets laid out according to the Ptolemaic system, each with its own ring so that it could rotate independently. The moving rings are in wood faced with stout sheets of copper enamelled in blue, with the numbers and the stars in gilded embossed copper; the signs of the Zodiac are particularly well-crafted and date from the original clock face. With the passage of days and months, the different speeds of the rings mean that the symbols of the sun and moon enter into the various constellations of the Zodiac.

—

North clock face to the Mercerie

This clock face comprises: an outer fixed ring in marble, inscribed with the hours in Roman numerals, within which is a tondo of mosaic scattered with golden stars. Inside this is a moving disk (about 170 cm in diameter) of flaming rays in embossed copper, with traces of original gilding; face of the sun serves to indicate the hours. At the centre is a copper St. Mark Lion; once gilded, this serves to cover the end of the axle transmitting power to the clock hand.
The heart of the Clock is a complicated system of gear wheels located within a large cruciform metal framework at the center of the Tower. The true ‘engine’ of the entire timepiece, this can be broadly divided into 4 distinct sections; along with these there is the machinery for the astronomical clock face and the workings of the clock barrels. Also known as ‘clock trains’, these 4 sections are similar in appearance and basically comprise: a barrel around which is wound a chain (formerly a rope) to which is attached the motor weight (100 kgs); an intermediate wheel; a rotating fan that serves as an aerodynamic brake to regulate the weight’s speed of descent and thus the interval between clock strokes. The fans are equipped with a ratchet that makes a very recognisable sound; this is activated at the end of each series of strokes and serves to disperse the accumulated kinetic energy when the rotating mechanism comes to an abrupt halt.

The clock train transmits the impulses which enable the pendulum to continue its isochronic oscillations. It also comes into play at fixed intervals to trigger the other trains of wheels and pins. By means of thin vertical rods, it activates the barrel machinery every 5 minutes; as a result the minute barrel rotates through 30° (1/12 of a turn). Every 60 minutes, the hour barrel does the same. Upon each hour, the train mechanism for the Two Moors is activated. Two minutes before the hour, the Moor on the right strikes the bell; two minute after the hour, it is the turn of the Moor on the left.
This is why the mechanism is described as a ‘re-striking’ one. With the hammers they hold, each Moor strikes the bell on the top of the tower a total of from one to twelve blows, depending upon the hour. Finally, every 12 hours, the 132-stroke train is set in motion. These 132 ‘meridian’ strokes occur at midday and midnight before the Moors strike the bell. They are rung by 2 supplementary hammers placed around the circumference of the bell; the number of strokes corresponds to that of the strokes hit by the two Moors in the previous 11 hours. The barrel mechanism also operates the astronomical machinery via the Moors wheel, which goes through a complete rotation every two hours, and a 22-tooth pinion. This latter goes through 12 rotations a day, turning all 264 teeth (22×12) on the large wheel, which turns the sun clock-hand through one entire circuit per day.

Finally, via a return mechanism and a long axle under the clock machinery, the Barrel Mechanism also operates the hour hand on the clock face giving onto the Mercerie. The whole thing is driven by means of 5 train mechanisms, periodically recharged by the raising of the weights.

The pendulum and the anchor escapement regulate the perfect release of energy, so that the mechanism works in a constant, even manner. Still perfectly functional, the entire structure dates back to 1753-57, when Bartolomeo Ferracina significantly modified the original machinery built at the end of the 15th century by G. Carlo Ranieri.
The barrels

The two rotating frames with the panels showing the hours and minutes were created and installed in 1858 by Luigi De Lucia; designed to make it easier for those down in St. Mark’s Square to get a more precise idea of the time, they are among the first examples of this kind of mechanism in a public clock. The two barrels each bear twelve panels of 80 by 50 cms; one with the hours in Roman numerals, the other with intervals of five minutes in Arabic numerals. Once lighted from inside the barrels, the panels are made of sheets of blue-tinted zinc. The installation of this mechanism blocked the movement of the Three Kings, so twice a year a special mechanism to raise and lift it backwards comes into play, freeing access to the doors and the notched circle along which the Three Kings and the Angel move in procession before the statue of the Madonna.

The three Kings and the Angel

When the Clock Tower was built in 1499, the Three Kings and the Angel with the Trumpet were designed to come out every hour from the loggia on the second storey of the structure and pass in procession before the statue of the Madonna and Child. However, the delicacy of the complex mechanism meant it was subject to great wear and tear over time, so eventually the procession had to be reduced in frequency or stopped altogether. After Ferracina had re-designed the clock mechanism, he also worked on that governing the procession (1758-159); still in use today, it comes into operation only twice a year: on the Epiphany and the Feast of the Ascension. The actual wooden statues of the Three Kings and the Angel were re-done by Giovanni Battista Alviero in 1755; as stratigraphical tests – and various inscriptions in the machine housing – show, these rather crude works have been restored and completely repainted on several times.

The doors

Originally, the doors from which the Three Kings and the Angel emerged in procession were wooden structures covered with painted and gilded metal and decorated with two gilded angels in embossed metal. In 1858, these doors have been absent for most of the year, replaced by two metal openings which are decorated with gilded geometric motifs and make it possible to reading the panels of the hours and minutes on the rotating barrels installed by Luigi De Lucia.

The Moors and the bell

The two giant statues in bronze (traditionally known as “The Moors” because of the patina on the metal) were cast in 1497 by Ambrogio della Ancore; the body is hinged at the waist to permit the movement made in striking the bell. In spite of their function, the modelling of the statues deliberately exaggerates their mass, so that their form is unmistakable, even from a great distance. The bell, surmounted by a gilded sphere and a cross, was also cast in 1497. It was the work of a certain Simeone, who has signed his name with a fine inscription in the bronze.

During the mid 19th century replacement of the roofing to the Tower, the bell and the two Moors were raised about a metre above their original level.

Restoration of the Clock Mechanism

1996-1999: Restoration of the clock mechanism

Over the centuries there has not only been restoration work to remedy the effects of wear and tear, but there have also been substantial functional and technical modifications.

In particular, a detailed survey and then a precise plan of restoration were undertaken in 1996, when Piaget underwrote all the costs of the work on the clock and associated mechanisms.

The first phases of work, which coincided with the 500th anniversary of the completion of the structure, involved conservation work on the clock. Subsequent phases involved consolidation of the tower structure and the re-installation of the, now fully functional, clock mechanism.

2012-2014: Maintenance and revision of the mechanism

After Piaget financed and provided horological advice for the restoration of the movement of the clock of the Tower of Venice and for the restoration of the mechanism of the clock in Palazzo Ducale in Venice (2006), the Fondazione Musei Civici di Venezia and Piaget sign a new agreement to reinforce their partnership. This agreement, valid for a contractual period of three years (2012-14), has as a subject the finance and support of the maintenance and revision services of the mechanism of the clock of the Tower of Venice.

Also, Piaget agrees to finance the special service and maintenance of the clock of Tower of Venice, such as the full revision of the mechanism of the clock and its components, as well as all the wearing parts. Such special revision will be performed every other year.

Piaget will be the exclusive contributor to the maintenance and servicing of the mechanism of the clock of the Tower of Venice for the duration of the agreement.
General information

How to get there

Correr Museum, St. Mark’s Square, Venice

Vaporetto
Line 1 Vallaresso stop o San Zaccaria stop
Line 2 Giardinetti stop
Line 5.1 / 5.2 / 4.1 San Zaccaria stop

—

Openign times

Monday to Wednesday: 10 am and 11 am
Thursday to Sunday: 2 pm and 3 pm

Close on December 25th and January 1st

—

Tickets

Visits only upon prior booking, with specialized guide. *

* Meeting point is the Ticket Office of the Correr Museum, 5 minutes before the departure time for the visit booked. Children under 6 are not allowed.

Full price>12,00

Reduced> 7,00*
Children aged from 6 to 14; students aged from 15 to 25; coordinators (max. 2) for groups of children or students; citizens over 65; Venetian residents; holders of Rolling Venice Card; holders of Museums of St. Mark’s Square ticket or the Museum Pass; those purchasing tickets for Secret Itineraries Tour in Doge’s Palace; ICOM members; Ministero dei Beni e delle Attività Culturali e del Turismo (MiBACT) staff; MUVE Friend Card holders, those purchasing tickets for Hidden Doge’s Special Tour.

Holders of the ticket for the Clock Tower get free admission to the Museo Correr, the Museo Archeologico Nazionale and the Monumental Rooms of the Biblioteca Marciana.

SPECIAL OPENING OF THE CLOCK TOWER

It’s possible to visit the Clock Tower after the closing time, sending a request at least 5 working days before the desired date, to verify the availability for an extraordinary opening of the museum.

Conditions and costs: purchase of at least 12 tickets*of 30,00 euros

* For safety reason, 12 people maximum are allowed to visit the tower in the same time

*ID is required
